

CARE OF LINEMEN RUBBER GLOVES AND SLEEVES

The protection against electrical shock that rubber gloves and sleeves can provide depends on their condition. It is the wearer's responsibility to maintain their gloves and sleeves in good condition or return them to the issuer.

Leather protectors sized to match, are essential to protect the softer rubber gloves.

NEVER USE RUBBER GLOVES WITHOUT LEATHER PROTECTORS.

Petroleum products, oils, greases, gasoline, diesel fuel, hydraulic fluid, hand creams, pasts, paints, and battery solution can ruin rubber gloves and sleeves in a few hours: clean or wash the gloves or sleeves as soon as practicable before the end of the day.

Do not keep rubber gloves or sleeves inside boxes, glove bags or leather protectors, which are dirty or contaminated with petroleum products.

Gloves and sleeves should not be kept inside out: except while inspecting, washing and drying

Gloves and sleeves should not be stored folded, creased, bundled, or flattened beneath other objects.

Rings, watches, jewelry and sharp objects **MUST NOT** be worn with rubber gloves.

Ozone, Bright sunlight, and high temperature are destructive to the rubber gloves and sleeves; do not expose them unnecessarily.

The wearer should inspect the gloves and sleeves inside and out **EACH** time they are used.

Return the rubber gloves and sleeves (but not the leather protectors) for testing when due, or when in doubt as to their condition.

Follow the supervisors' and equipment manufactures instructions and safe work practices.
